Quick Class Model

Overview of Work

Subservices/Modules

We use WebSocket technology for live updates.

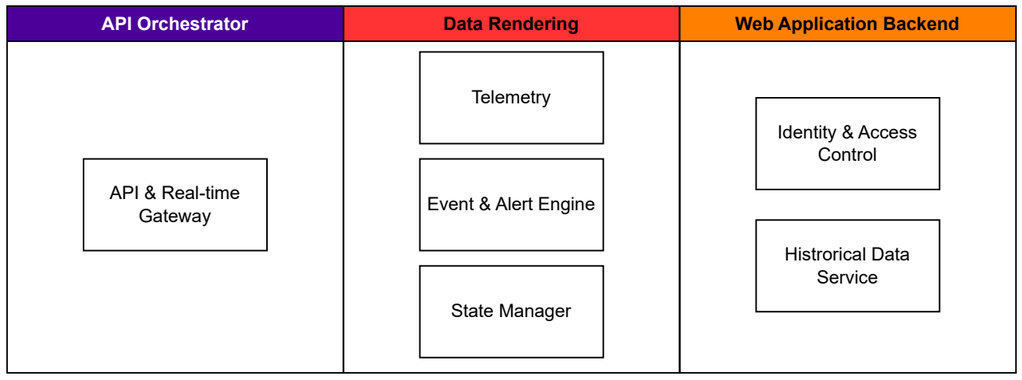

System failures are seen in the event logs.

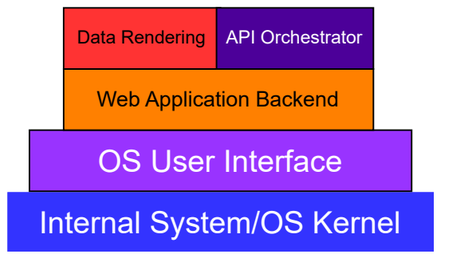

Could be cancelled

Give Data To

Telemetry	1	Collects the data (from the API) and load insights to the dashboard webpage.	
State Manager	2	Showing the states of the services.	On/Off/Pending
Event & Alert Engine	3	System success/failure detection	
Historical Data Service	4	Previous insights and metrics records to be seen again by the manager	How to achieve the speed of getting and storing the insights?
API & Real-time Gateway	5	Fetching the service to get and load the data coming from the service.	
Identity & Access Control	6	Enforce Permissions and Privileges for a user, Responsible for the access control levels to restrict seeing some insights for example.	Authentication & Authorisation

Modules Map

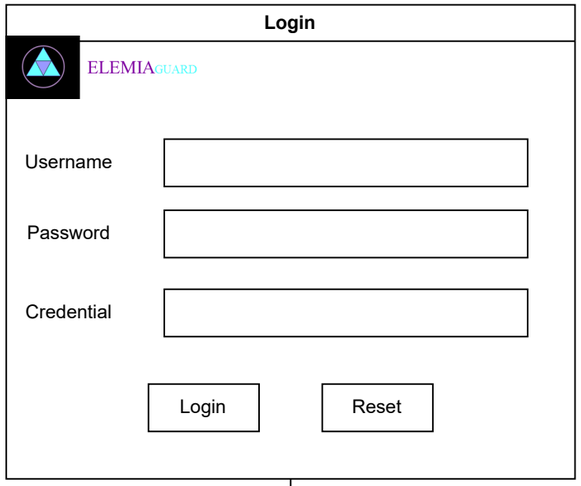

Two applications in the same device

But it is preferred to be in different devices.

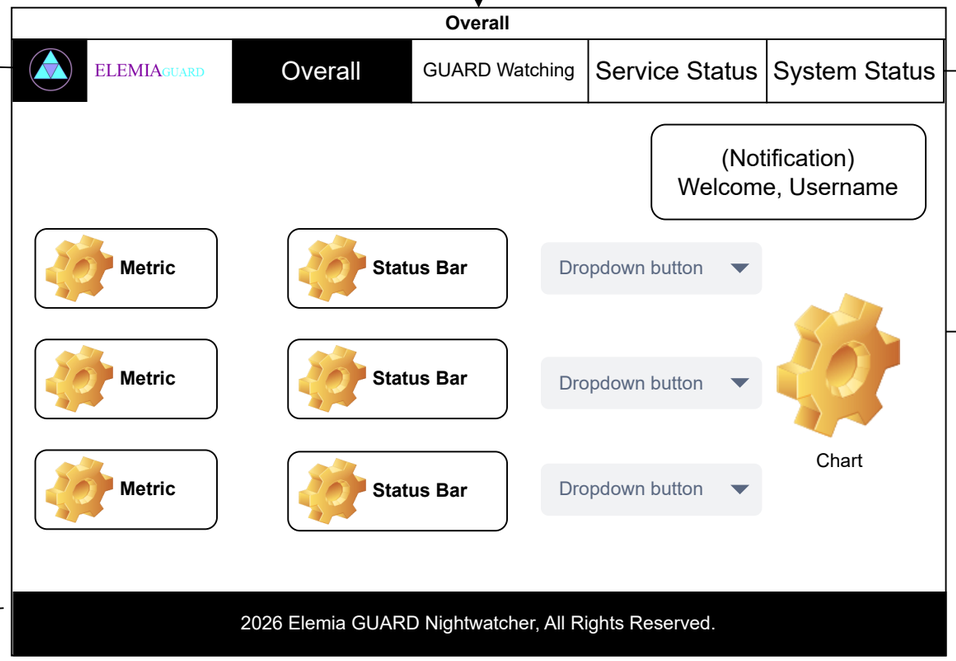

The design should be the same of Elemia GUARD theme.
(Colours and Layouts)
Colour Wheel is provided for the frontend developer.

The webpages here are just some examples and are not conditionally to be applied as it is.

Overview of Layers

Services Workflow Layers

They can be inside only one server.

The route is the combination between the HTTP method and the method path.

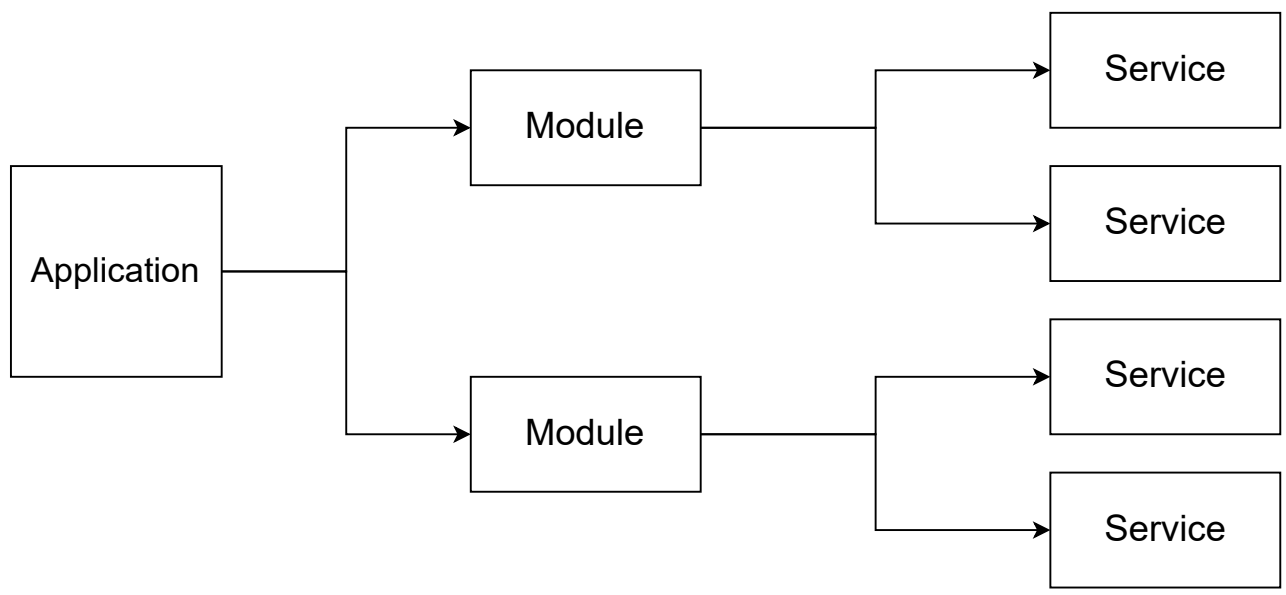

The distribution between the orchestrators and services are the responsibility of the developer.

Module vs. Service

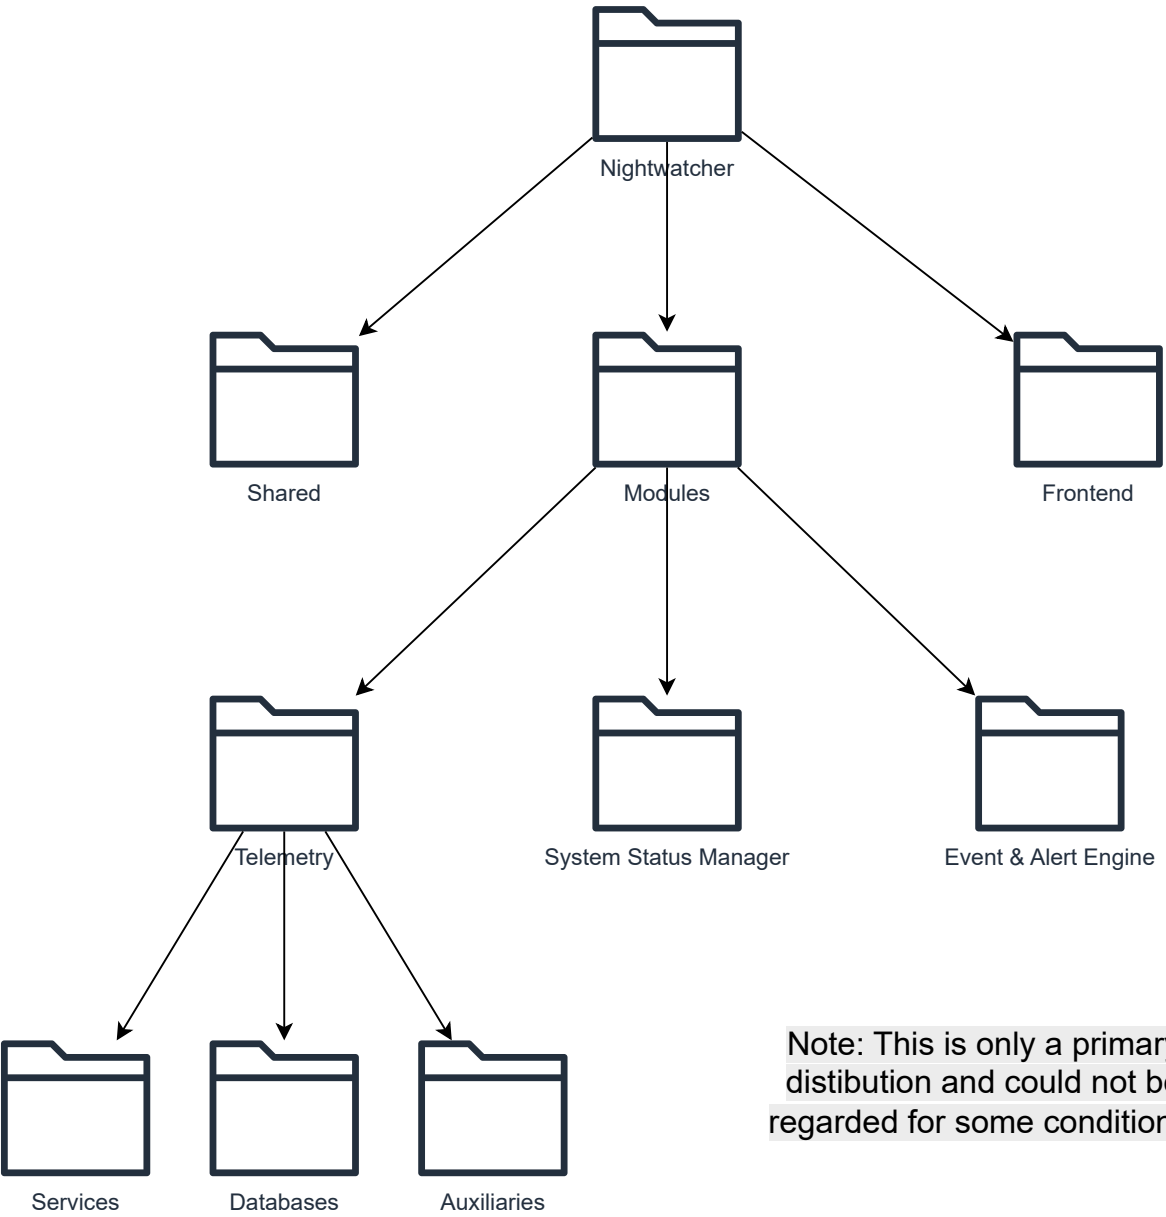

The module may have many services

The module:Dividing what can the program do into some divisible parts.

The service: Physical part of a module to deploy part of it.

Suggested GitHub Directory Mapping

Note: This is only a primary distibution and could not be regarded for some conditions.
